LISTING OF CLAIMS

- 1.-3. (Cancelled)
- 4.-5. (Withdrawn)
- 6. (New) An ethanol production process including the steps of mixing a starchcontaining feedstock, water, and a hydrolyzing agent to form a liquefied mash,
 adding a fermentation agent to the liquefied mash, fermenting the liquefied mash
 under fermentation conditions to form a beer containing at least 10% ethanol by
 volume, distilling the beer to form an ethanol-rich stream and a whole stillage
 steam, wherein the improvement comprises:
 - (a) adding to the liquefied mash a secondary treatment agent whereby the fermentation agent and the secondary treatment agent are present during the fermenting, wherein:
 - i. the secondary treatment agent is selected from a group consisting of bacteria, enzymes, fungi, or combinations thereof, that can convert under the fermentation conditions at least a portion of the liquefied mash to a pre-selected non-ethanol by-product or precursors thereof;
 - ii. the secondary treatment agent has the characteristics of remaining active in the presence of the ethanol contained in the beer being formed during the fermenting of the liquefied mash.
 - the secondary treatment agent under the fermentation conditions

 converts at least a portion of the liquefied mash during the fermenting

 of the liquefied mash into the pre-selected non-ethanol by-product or

 precursors thereof, and

- iv. the activity of the secondary treatment agent does not prevent the fermentation of the liquefied mash to produce the beer having at least 10% ethanol by volume; and
- (b) <u>distilling the beer containing the pre-selected non-ethanol by-product to</u>

 produce the ethanol-rich stream and the whole stillage stream containing

 the pre-selected non-ethanol by-product; and
- (c) separating the pre-selected non-ethanol by-product from the whole stillage stream.
- 7. (New) A process according to claim 1 wherein the fermentation conditions comprise fermenting at 20°C 40°C and at a pH between 4.0 and 6.5.
- 8. (New) A process according to claim 7 wherein the starch-containing feedstock comprises milled com, the pre-selected non-ethanol by-product comprises cyclodextrin, and the secondary treatment agent is cyclodextrin glucosyl transferase.
